

Template Week 6 – Networking

Student number:566787

Assignment 6.1: Working from home

Screenshot installation openssh-server:

Screenshot successful SSH command execution:

Screenshot successful execution SCP command:

Screenshot remmina:

Assignment 6.2: IP addresses websites

Relevant screenshots nslookup command:

Screenshot website visit via IP address:

Assignment 6.3: subnetting

How many IP addresses are in this network configuration 192.168.110.128/25?

What is the usable IP range to hand out to the connected computers?

Check your two previous answers with this calculator:

<https://www.calculator.net/ip-subnet-calculator.html>

Explain the above calculation in your own words.

Assignment 6.4: HTML

Screenshot IP address Ubuntu VM:

Screenshot of Site directory contents:

Screenshot python3 webserver command:

Screenshot web browser visits your site

Bonus point assignment – week 6

Remember that bitwise java application you've made in week 2? Expand that application so that you can also calculate a network segment as explained in the PowerPoint slides of week 6. Use the bitwise & AND operator. You need to be able to input two Strings. An IP address and a subnet.

IP: 192.168.1.100 and subnet: 255.255.255.224 for /27

IP Address:

Subnet Mask:

Example: 192.168.1.100/27

Calculate the network segment

IP Address: 11000000.10101000.00000001.01100100

Subnet Mask: 11111111.11111111.11111111.11100000

Network Addr: 11000000.10101000.00000001.01100000

This gives 192.168.1.96 in decimal as the network address.

For a /27 subnet, each segment (or subnet) has 32 IP addresses (2^5).

The range of this network segment is from 192.168.1.96 to 192.168.1.127.

Paste source code here, with a screenshot of a working application.

```

public void run() {
    String IP = SaxionApp.readString();
    String SUBNET = SaxionApp.readString();

    String[] ip = IP.split("\\.");
    String[] subnet = SUBNET.split("\\.");

    for (int i = 0; i < 4; i++){
        int ipSegment = Integer.parseInt(ip[i]);
        int subnetSegment = Integer.parseInt(subnet[i]);
        int result = ipSegment & subnetSegment;
        if(i<3) SaxionApp.print(result+".");
        else SaxionApp.print(result);
    }
}

```

```

3 public class Application implements Runnable {
5     public static void main(String[] args) { SaxionApp.start(new Application(), width: 300, height: 200);
8
9     public void run() {
10         String IP = SaxionApp.readString();
11         String SUBNET = SaxionApp.readString();
12
13         String[] ip = IP.split( regex: "\\.");
14         String[] subnet = SUBNET.split( regex: "\\.");
15
16         for (int i = 0; i < 4; i++){
17             int ipSegment = Integer.parseInt(ip[i]);
18             int subnetSegment = Integer.parseInt(subnet[i]);
19             int result = ipSegment & subnetSegment;
20             if(i<3) SaxionApp.print(result+".");
21             else SaxionApp.print(result);
22         }
23
24     }
